

1     **ABSTRACT OF THE DISCLOSURE**

2             Brackets for a clotheshorse are used in pairs. Each bracket has  
3     multiple collars that align respectively with multiple collars defined in the  
4     other opposite bracket. A vertical socket is formed at a bottom of the bracket  
5     in which a telescoping rod of the clotheshorse is mounted. Multiple slots are  
6     vertically defined in the bracket and extend inward to respectively  
7     communicate with the multiple collars to hold longitudinal members of a  
8     rack inside the multiple collars through the slots. Thereby, a bracket  
9     assembly mounted on the clotheshorse enables versatile accessories to be  
10    mounted on the clotheshorse.
